Measuring and Monitoring Non-Tariff Distortions with Special Reference to Agricultural Commodities: Peter Julius Lipps - 1991

This paper presents measures which have arisen from the growth of non-tariff measures (NTMs). The non-tariff measures of government intervention in commodity markets, especially for agricultural commodities. In order to understand the international trade implications of these measures, the paper develops a theory that shows how international trade can be distorted by such measures and how their impact depends on the prices of goods and the quantities of goods involved. This theory is applied to a specific case study of the international trade of coffee. The paper concludes with a discussion of some policy implications and recommendations for future research.
