Logic provides students with the concepts and skills necessary to identify and evaluate arguments effectively. Logic is about the principles of good arguments. Throughout this course, the basics of logic serve as a template for examining arguments of philosophers and for developing student arguments of their own. In philosophy as in any other field, the quality of an argument is often a matter of the quality of the particular points it makes, the way those points are related, and the overall logical structure of the argument. Authors of logical introduction to philosophy text appear to have generally made use of common terms rather than to promote unique concepts. Logical Reasoning: Examples and Definition | Philosophy Terms

Logical reasoning (or just "logic" for short) is one of the fundamental skills of effective thinking. It works by making guesses like: If this is true, what else must be true? If this is true, what else is probably true? If this isn't true, what else can't be true? These are all inferences. They are connections between a given sentence (the "premise") and some other sentence.

The logical operator "and" can be symbolized as a dot or an ampersand. In addition to propositions, propositions also contain smaller elements—operators on propositions. Propositions can be thought of like the sticks of a tinker-toy set. Operators are like the connecting blocks. By adding more and more operators, we get more complex structures.

Pluralism (philosophy) - Wikipedia

Pluralism is a term used in philosophy, meaning "doctrine of multiplicity," often used in opposition to monism ("doctrine of unity") and dualism ("doctrine of duality"). The term has different senses in metaphysics, ontology, epistemology and logic. In metaphysics, pluralism is the doctrine that—contrary to the assertions of monism and dualism—there are in fact many different substances.
