Aging is a complex process that involves both biological and social factors. As societies become more diverse, there is a need to understand how aging intersects with race, gender, and other social identities. This is particularly important in the context of the global south, where aging is often framed as a problem of descriptive and empirical studies.

The book also addresses the cultural, theoretical, and policy implications of aging in the context of race and technology. It provides a comprehensive perspective on technology and aging, emphasizing the importance of understanding the human factor in the development and use of technology. The contributors argue that technology should be designed and used in a way that respects the needs and desires of elderly users.

In conclusion, this book provides a valuable resource for researchers, practitioners, and policymakers interested in aging, technology, and society. It offers a multidisciplinary perspective on the intersection of aging and technology, highlighting the importance of cross-cultural, theory-driven, and interdisciplinary research in the field of gerontology.
